-!- FUNCTION: Converts 2C-methyl-D-erythritol 2,4-cyclodiphosphate
-(ME-2,4cPP) into 1-hydroxy-2-methyl-2-(E)-butenyl 4-diphosphate
(By similarity).

-!- PATHWAY: Nonmevalonate terpenoid biosynthesis pathway; sixth step.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              "Genome sequence of the endocellular bacterial Buchnera sp. APS.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         MEDLINE=20445173; PubMed=10993077; Shigenobu S., Watanabe H., Hattori

Nat. Genet. 32:402-407(2002).
-!- FUNCTION: Converts 2C-methyl-D-erythritol 2,4-cyclodiphosphate (ME-2,4cPP) into 1-hydroxy-2-methyl-2-(E)-butenyl 4-diphosphate (By similarity).
-!- PATHWAY: Nonmevalonate terpenoid biosynthesis pathway; sixth step.
-!- SIMILARITY: BELONGS TO THE ISPG FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SEQUENCE FROM N.A.

"50 million years of genomic stasis in endosymbiotic bacteria.";
Science 296:2376-2379(2002).
-!- FUNCTION: Converts 2C-methyl-D-erythritol 2,4-cyclodiphosphate
(ME-2,4CPP) into 1-hydroxy-2-methyl-2-(E)-butenyl 4-diphosphate
(By similarity).
-!- PATHWAY: Nonmevalonate terpenoid biosynthesis pathway; sixth ste-
-!- SIMILARITY: BELONGS TO THE ISPG FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   the European Bioinformatics Institute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        implete genome sequence of Vibrio vulnificus CMCP6."; imitted (DEC-2002) to the EMBL/GenBank/DDBJ databases. FUNCTION: Converts 2C-methyl-D-erythritol 2,4-cyclodiphosphate (ME-2,4cPP) into 1-hydroxy-2-methyl-2-(E)-butenyl 4-diphosphate (By similarity).
PATHWAY: Nonmevalonate terpenoid biosynthesis pathway; sixth stesimilarity: BELONGS TO THE ISPG FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    _VIBVU

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Bacteriol. 185:2330-2337(2003).

- FUNCTION: Converts 2C-methyl-D-erythritol 2,4-cyclodiphosphate (ME-2,4cPP) into 1-hydroxy-2-methyl-2-(B)-butenyl 4-diphosphate (By similarity).

- PATHWAY: Nonmevalonate terpenoid biosynthesis pathway; sixth stellarity: BELONGS TO THE ISPG FAMILY.
                                  301

The proteins described include 1-deoxy-D-xylulose-5-phosphate reductoisomerase, 1-deoxy-D-xylulose-5-phosphate synthase and the gcpE protein. The products of the invention have antimycotic, antibiotic, antiparasitic, antimicrobial, bactericide, fungicide and herbicide activity. The encoding nucleic acid sequences of the invention are used for prevention or treatment of diseases in humans and animals and also to screen compounds enzyme inhibitory activity (potential antimicrobials, antiparasitic agents, antivirals, fungicides, bactericides and herbicides, for use in human or veterinary medicine or agriculture). This sequence represents the Plasmodium falciparum gcpE protein described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence

                                                   The invention relates to gcpE nucleic acid molecule, an essential gene CC of methyl-D-erythricol phosphate (MEP) pathway) that encodes rice, Arabidopsis thaliana or Escherichia coli GCPE protein. gcpE is useful CC canola, castor bean, coconut, cotton, crambe, linseed, maize, mustard, CC canola, castor bean, coconut, cotton, crambe, linseed, maize, mustard, CC oil palm, peanut, rapsesed, rice, safflower, seasme, soybean, sunflower, CC or wheat with an increased isoprenoid (tocopherol) compound level. The CC expression of GCPE protein in organisms increases the level of CC tocopherol substrate such as isopentyl diphosphate and dimethylallyl CC diphosphate biosynthesis. Transgenic organisms overexpressing GCPE protein can nutritionally enhance food and feed sources. Overexpression CC of GCPE protein in transgenic plant may provide tolerance to stresses CC e.g., oxidative stress tolerance such as to oxygen or ozone, UV tolerance, etc. gcpE may be used to obtain nucleic acid molecules from CC the same species, and to obtain nucleic acid homologues. gcpE is also used as or primers. The recombinant vectors are used in plant CC the same species, and to obtain sucleic acid homologues. gcpE is also used to deternine the level or pattern of expression of the protein. The present sequence is Arabidopsis thaliana GCPE protein. The present sequence is Arabidopsis thaliana GCPE protein.
Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        gcpE nucleic acid which is an essential gene of the methyl-D-erythritol phosphate pathway, encoding a fully defined GCPE protein which is useful for increasing levels of tocopherol substrates in plants -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         gcpE gene; methyl-D-erythritol phosphate; MEP; dimethylallyl diphosphate; transgenic plant; isoprenoid compound; tocopherol; isopentyl diphosphate; food; feed source, transfection; single nucleotide polymorphism; SNP; oxidative stress tolerance; UV tolerance; transformation; chromosome V;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Best Local Similarity
                      This invention describes a novel method for incorporating gcpE and yfgB genes into viruses and cells for increasing isoprenoid content and identifying e.g. antimicrobial agents, comprises using DNA sequences (I) from the gcpE or yfgB genes of bacteria or parasites or DNA sequences (II) which hybridize to the specified genes or encode a plastid protein with the same biological activity as those encoded by the genes. The invention also describes (I) plant cells containing (I) or (II); (2) transformed plant cells, and transgenic plants regenerated from them, that contain (I) or (II); (3) determining the enzymatic activity of a gcpE protein; or (4) screening compounds (A) that have antimycotic, antiparasitic or antiviral activity in humans or animals or antiviral.
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Incorporating gcpE and yfgB genes into viruses and cells, for increasing isoprenoid content and identifying e.g. antimicrobial agents, comprises using DNA sequences from bacteria or parasites

The polypeptides can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis; pneumopathy in breast feeding infants; and venereal lymphogranulomatosis. (I) are encoded by genes (II) whose expression is induced or up-regulated during culture of a mycobacterium under conditions defined by a dissolved oxygen tension of at least 10% air saturation measured at 37 plus degrees Celsius, when compared with a dissolved oxygen tension of at least 40% air saturation measured at 37 plus degrees Celsius. (I) and (II) have antibacterial, tuberculostatic and immunostimulant activities, and can be used in vaccines and gene therapy. (I) and (II) can be used for the manufacture of a medicament for treating or preventing a mycobacterial infection. They can also be used for the manufacture of a diagnostic reagent for identifying a mycobacterial infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to proteins from Neisseria gonorrhoeae. Also disclosed are the nucleic acid molecules encoding the proteins and antibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABP76736-ABP81046 represent nucleic acid molecules of the invention.
                                                                                                                         Chlamydia trachomatis
                                                                                                                                                                                                                                                                                                                                                     Amino acid

                          This invention relates to a method for identifying a nucleotide or polypeptide sequence that may be a drug target, or essential for growth or viability of an organism. Polypucleotide sequences AAH51947 - AAH52092 represent DNA encoding proteins AAG81096 - AAG81241, Mycobacterium tuberculosis proteins which are potential drug targets. The DNA and protein sequences are used to illustrate the method of the invention. The method involves providing an unknown nucleotide or polypeptide sequences, and comparing it to a number of sequences along with at least one algorithm capable of analysing a functional relationship between nucleotide and polypeptide sequences. The method is useful for characterising the function of nucleic acids and polypeptides that may be useful as a target for a drug or essential for the growth or viability of
                                                                                                                                                                                                                                                                                 Identifying nucleotide or polypeptide sequence for use as drug target, involves providing algorithm that analyzes a functional relationship between nucleotide or polypeptide sequences, and comparing the

                                                                    망
                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                    ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis.

P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a partient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (BLISA).

Note: The sequence data for this patent did not form part of the printed as for the printed in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                          Query Match

                                                                                                   The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 given in ABP65258 to ABP66354 ligated in frame to a polynucleotide encoding a heterologous polypeptide. (I) has antidiarrheic and antibacterial activities, and can be used as an inhibitor of Salmonella. (I) (which is a probe) is useful for the detection and/or identification of Bifidobacterium longum in a biological sample. A carrier containing the lactic acid bacterium Bifidobacterium longum NCC2705 (CNCM I-2618) can be used for preventing and/or treating diarrhoea brought about by pathogenic bacteria and/or rotavirus. The carrier is a food composition selected from milk, yogurt, curd, cheese, fermented milks, milk based fermented products, ice-creams, fermented cereal based products, milk based sade powders, infant formula, pet food or a pharmaceutical composition selected from tablets, liquid bacterial suspensions, dried oral supplement, wet oral supplement, dry tube feeding or wet tube feeding. (I) is useful in DNA arrays or chips to carry out analysis of the expression of the Bifidobacterium gene. ABQ81844 to ABQ81850 represent listing from the present invention but not mentioned further within the

The polypeptides can be used for preventing or treating Helicobacter infections, and gastroduodenal diseases associated with these infections, including acute, chronic, and atrophic gastritis, a peptic ulcer diseases, e.g. gastric and duodenal ulcers. They can also used for the production of antibodies. The products can also be used detection and diagnosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        δ
                                                                                           The present invention relates to the genome sequence of Listeria monocytogenes EGD-e (see ABA03041). The genome sequence and fragments of it are useful for selecting probes and primers for detecting genes in L. monocytogenes and related organisms, and for studying genetic polymorphisms and other genomes. The present sequence is a protein encoded by the genome sequence of the present invention. Proteins expressed from the genome sequence are useful for raising specific antibodies, identification of L. monocytogenes and related organisms, and for biosynthesis and biodegradation, especially biosynthesis of Vitamin B12. The genome sequence and proteins encoded by it are also useful for selecting compounds that regulate gene expression and cell replication and modulate L. monocytogenes-related diseases. In addition, the genome sequence and proteins encoded by it are useful in pharmaceutical and vaccines compositions for the treatment or prevention of infections by L.
                            monocytogenes and related organisms.
Note: The sequence data for this patent did not specification, but was obtained in electronic fo at ftp.wipo.int/pub/published_pct_sequences.

The present invention describes a polynucleotide (I) comprising a sequence of a Bifidobacterium genome selected from the nucleotide sequences given in ABQ81842 and ABQ81843, or a sequence exhibiting at least 90% identity or which hybridises with the sequences given in ABQ81842 and ABQ81843. Also described is a polynucleotide (II) encoding a fusion protein, comprising a sequence selected from 1097 sequences

The invention also describes (I) plant cells containing (I) or (II); (2) transformed plant cells, and transgenic plants regenerated from them, that contain (I) or (II); (3) determining the enzymatic activity of a gcpE protein; or (4) screening compounds (A) that have antimycotic, antiparasitic, fungicidal activity in humans or animals or antiviral, are used: (i) to increase the isopremoid levels in viruses and cells; (ii) for determining the enzymatic, activity of gcpE and yfgB proteins;

                                                                                                                                                                                                                                                                                                                                                                                                                                  CC canola, castor bean, coconut, cotton, crambe, linseed, maize, mustard, cotton, crambe, linseed, maize, mustard, coil palm, peanut, rapeseed, rice, safflower, sesame, soybean, sunflower, cor wheat with an increased isoprenoid (tocopherol) compound level. The compression of GCPE protein in organisms increases the level of coopherol substrate such as isopentyl diphosphate and dimethylallyl diphosphate biosynthesis. Transgenic organisms overexpressing GCPE protein can nutritionally enhance food and feed sources. Overexpression cof GCPE protein in transgenic plant may provide tolerance to stresses coeff. oxidative stress tolerance such as to oxygen or ozone, UV cottolerance, etc. gcpE may be used to obtain nucleic acid molecules from the same species, and to obtain nucleic acid homologues. gcpE is also cused as or primers. The recombinant vectors are used in plant cransformation or transfection. gcpE an also act as markers capable of detecting polymorphisms such as single nucleotide polymorphisms (SNPS). gcpE is also used to determine the level or pattern of expression of the protein. The present sequence is Escherichia coli GCPE protein.
                                                                                                                                                                                                                                                                                                                                                 Query Match
